

ROOF EDGE BRACKET

Adjustable + Versatile

The Panel Plate Roof Edge Bracket is a robust assembly that secures facade panels to the wood blocking at the roof edge over the roof membrane without voiding the roof membrane warranty.

- Creates the wrap-around look at the roof edge.
- Creates proper drainage back onto the roof.
- Creates proper ventilation for rain screen panels that need airspace at the top of the wall.
- Engineered to withstand high wind uplift pressures.
- Replaces unsightly roof membrane edge securement.
- Eliminates the need to pick out colors and metal gauge for the roof securement.

Use with HPL panels, fiber cement panels, UHPC concrete panels, composite metal panels (ACM or MCM), terracotta, sintered stone panels and a variety of other panels that are capable of being used in low-pitch applications.
